Key Insights & Recommendations

FINDINGS

1. Electronics dominates revenue but Beauty is the silent high-value segment

- Electronics leads total revenue at \$389K (35.3%) driven by **volume** — **388 orders**. But Beauty has the **highest average order value at \$1,090** with only 151 orders, meaning each Beauty transaction is worth more than any other category

2. Discounting is actively reducing revenue — not driving it

- Low discount orders average **\$1,095 revenue** while High discount orders average only **\$848** — a 22.7% drop. The correlation between discount and revenue is **-0.125**, meaning more discounting consistently produces smaller orders, not larger ones.

3. Delivery speed is not the problem — something else is driving low ratings

- The overall average customer rating is **2.97/5** — **below the midpoint**. The statistical test ($p=0.199$) confirms delivery speed does NOT cause this — fast and slow deliveries produce nearly the same rating (3.02 vs 2.91). The root cause of dissatisfaction lies elsewhere.

4. Repeat customers are the backbone — but Wallet users are the highest-satisfaction segment

- Repeat customers (314 people) generate \$761K — 2.24× more than one-time customers (331 people, \$340K). Separately, Wallet payment users give the highest avg rating (3.06) yet represent only 17.7% of revenue — they are satisfied but under-represented.

5. COD is slowing delivery and should be nudged toward digital payments

- COD orders take an average of 6.48 days to deliver — 0.73 days slower than Card payments (5.75 days) and have the lowest avg order value (\$968). COD represents 22.6% of all orders (\$270K), generating 14% of total revenue but accounting for 21% of all orders.

RECOMMENDATIONS

1. Electronics dominates revenue but Beauty is the silent high-value segment

→ Recommendation

Investigate the **marketing exposure for Beauty**. If it converts at high value but low volume, the problem may be discovery — not product quality or pricing. A targeted ad push or homepage promotion for Beauty could unlock significant revenue with minimal discounting needed.

2. Discounting is actively reducing revenue — not driving it

→ Recommendation

Reduce blanket discounting immediately — especially High (30%+) discounts. Replace with targeted promotions: loyalty discounts for repeat customers only, or category-specific offers tied to slow months. Consider A/B testing: run 2 weeks with no discounts and compare revenue

3. Delivery speed is not the problem — something else is driving low ratings

→ Recommendation

Investigate product quality and post-purchase experience as the likely drivers of low satisfaction. Survey customers who rated 1–2 stars. Check if rating correlates with specific products, sellers, or return rates. Do NOT invest further in faster delivery — the data shows it won't move the satisfaction needle.

4. Repeat customers are the backbone — but Wallet users are the highest-satisfaction segment

→ Recommendation

Build a loyalty programme targeting one-time buyers — converting even 10% of one-time buyers to repeat would generate ~\$34K additional revenue. For Wallet users specifically: introduce cashback or exclusive deals to grow this already-satisfied segment into a larger revenue share.
